# Description of RCC

- **Approximately 90% of all kidney cancers are RCC<sup>1</sup>**
  - RCC typically develops in the lining of the kidney tubules<sup>2</sup>
    - There are 2 main histological subtypes: clear cell and non-clear cell<sup>3</sup>
- **The remaining 10% of kidney cancers include transitional cell carcinomas, Wilms' tumors, and renal sarcomas<sup>1</sup>**
- **RCC is classified as an “immunogenic” tumor based on these characteristics<sup>4</sup>:**
  - Incidence of spontaneous tumor regression in the absence of therapy<sup>4</sup>
  - High level of tumor T-cell infiltration<sup>4</sup>
  - Responsiveness to immunotherapies such as IL-2 and IFN- $\alpha$ <sup>4</sup>

Adapted from Medscape.com.<sup>5</sup>

Renal cell carcinoma

IFN- $\alpha$ , interferon- $\alpha$ ; IL-2, interleukin-2; RCC, renal cell carcinoma.

# Reversible inhibition of tumor angiogenesis by VEGFR-TKI – what is the reason of regrowth?

# Rationale for Immunotherapy in RCC

- Spontaneous advanced RCC remissions attributed to the immune system have been observed<sup>1</sup>
- RCC exhibits immune cell infiltrates, and several immune escape mechanisms have been reported in RCC<sup>2,3</sup>
- Historically, the mainstay of treatment for patients with mRCC was immunotherapy with interleukin-2 or interferon- $\alpha$ 1
- I-O is an evolving treatment modality encompassing agents designed to directly harness the patient's own immune system to fight cancer<sup>7,8</sup>

Studies have documented alterations in various immune cell types in RCC, including<sup>3–6</sup>:

| Tregs  | CD45 + Memory T Cells   | CD8 + T Cells   | CD4 + T Cells   |

## Clinical activity and molecular correlates of response to atezolizumab alone or in combination with bevacizumab versus sunitinib in renal cell carcinoma

- Three biological axes:

- Tumor angiogenesis:

- Angio - High / Angio - Low → higher vascular density as evaluated by CD31

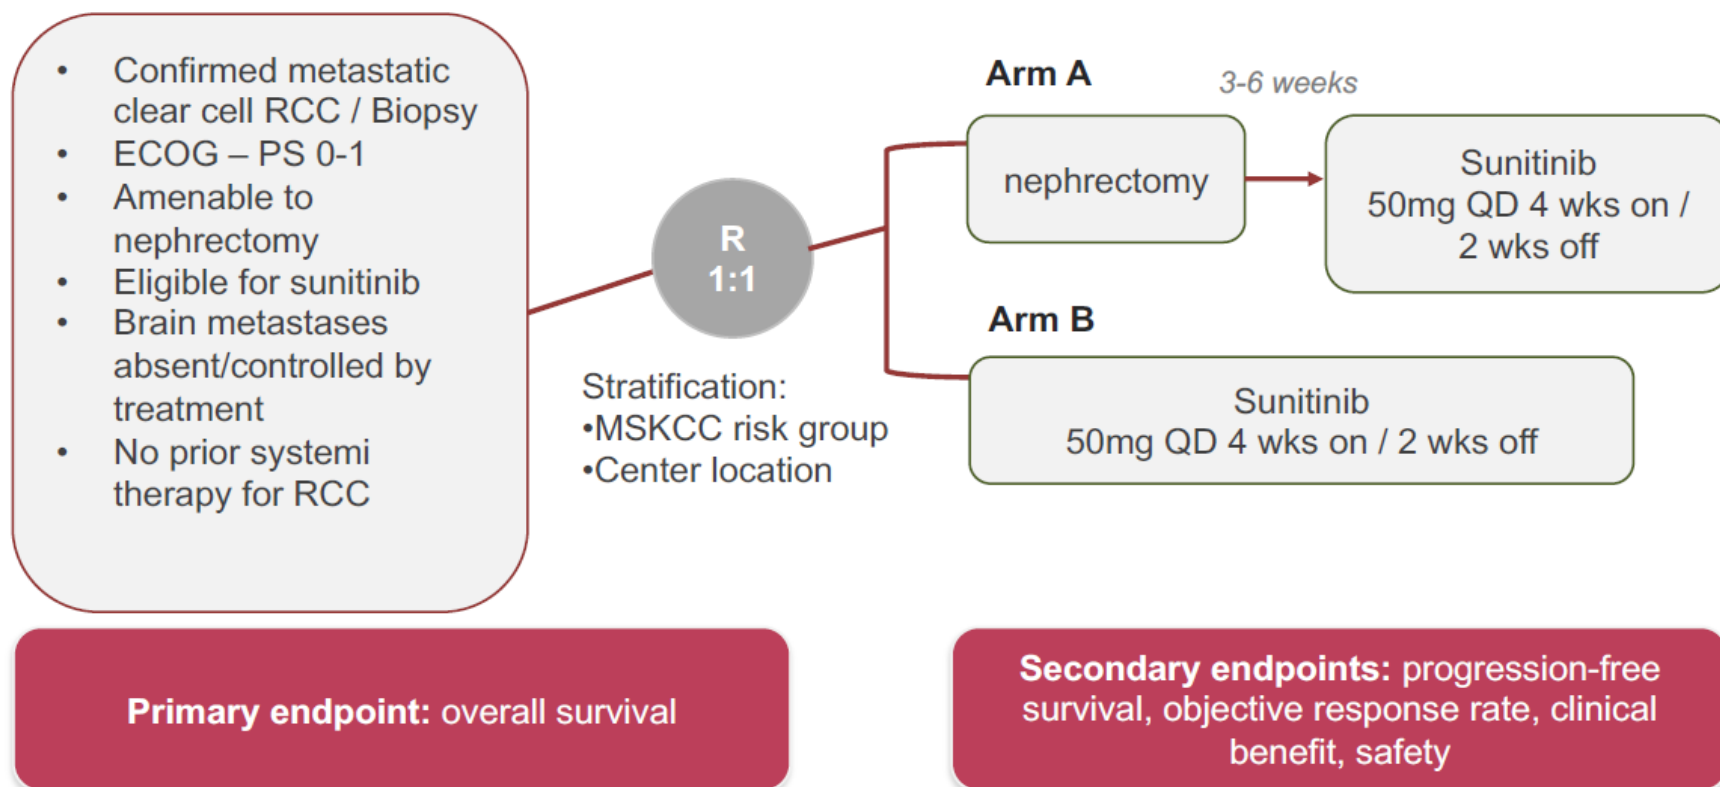

- Pre-existing immunity

- T<sub>eff</sub> High and T<sub>eff</sub> Low → protein expression of PD-L1 and CD8 T-cell infiltration

- Immunosuppressive myeloid inflammation:

- T<sub>eff</sub> High and T<sub>eff</sub> Low → expression of genes associated with myeloid inflammation

# CARMENA: Prospective, multicenter, open-label, randomized, phase 3 non-inferiority study

*LPI, last patient included; MSKCC, Memorial Sloan Kettering Cancer Center; QD, once daily; R, randomization; RCC, renal cell carcinoma*

# Overall survival (ITT)

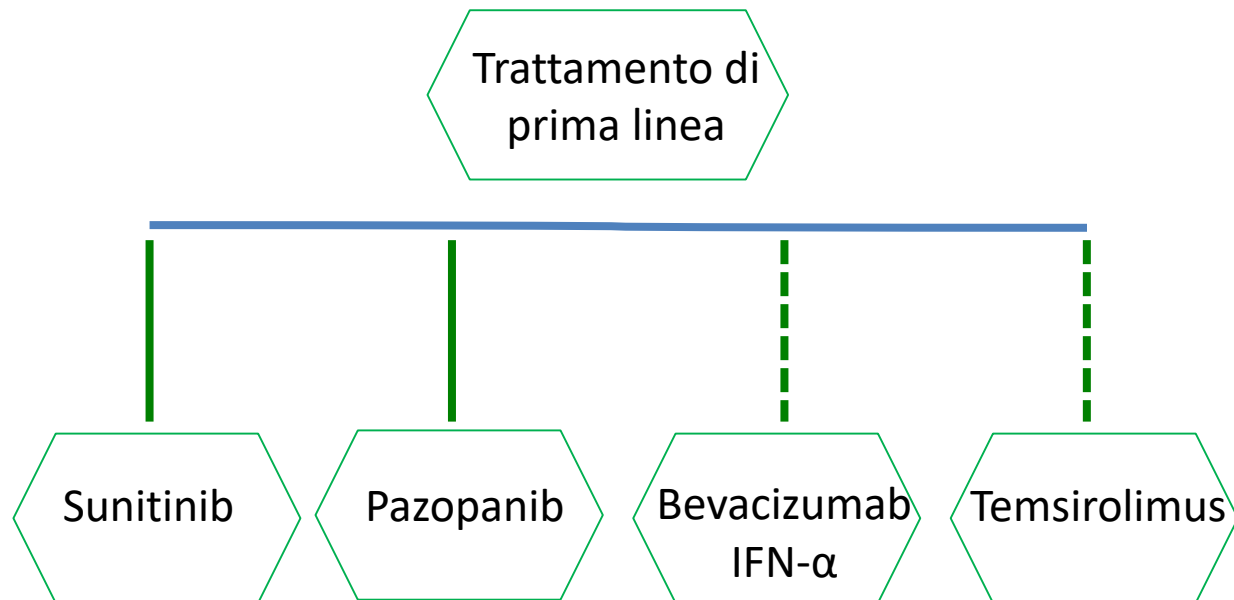

Median follow-up was 50.9 months (range 0.0-86.6)

Presented By Arnaud Mejean at 2018 ASCO Annual Meeting

 **800-849980**

**SENTIAMOCI!**

*Si ringrazia per la collaborazione:*

# Cosa ci aspettiamo dal therapy management

**Minori effetti collaterali**

**Maggiore aderenza al trattamento**

**Un migliore outcome**

# Come si realizza il therapy management

**GESTENDO LA DOSE DEL FARMACO**

**UTILIZZANDO UNA SCHEDULA DI SOMMINISTRAZIONE  
PERSONALIZZATA**

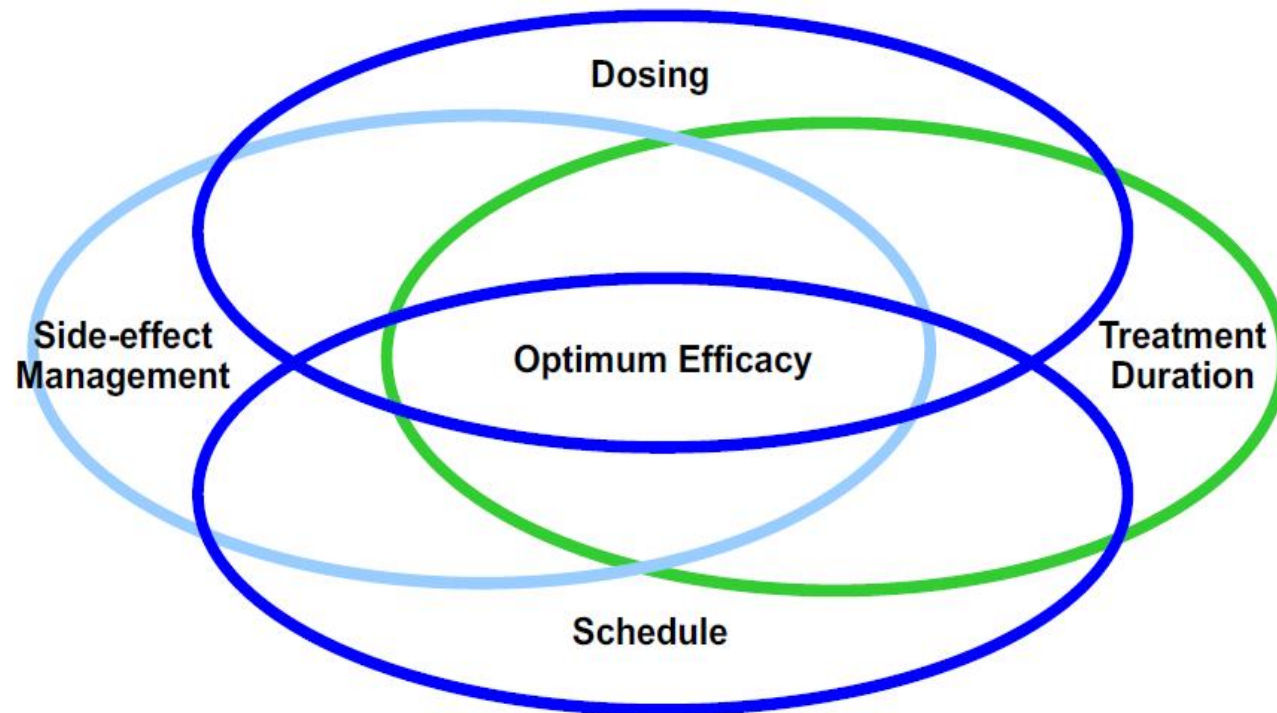

**MASSIMIZZANDO LA DURATA DEL TRATTAMENTO**

**GESTENDO ATTIVAMENTE GLI AEs**

## Punti chiave del Therapy Management

- **Importanza del rapporto dose/risposta**
- Concetto di variabilità interpersonale nella biodisponibilità dei farmaci
- Strategia per prevenire l'insorgenza della resistenza al target VEGF

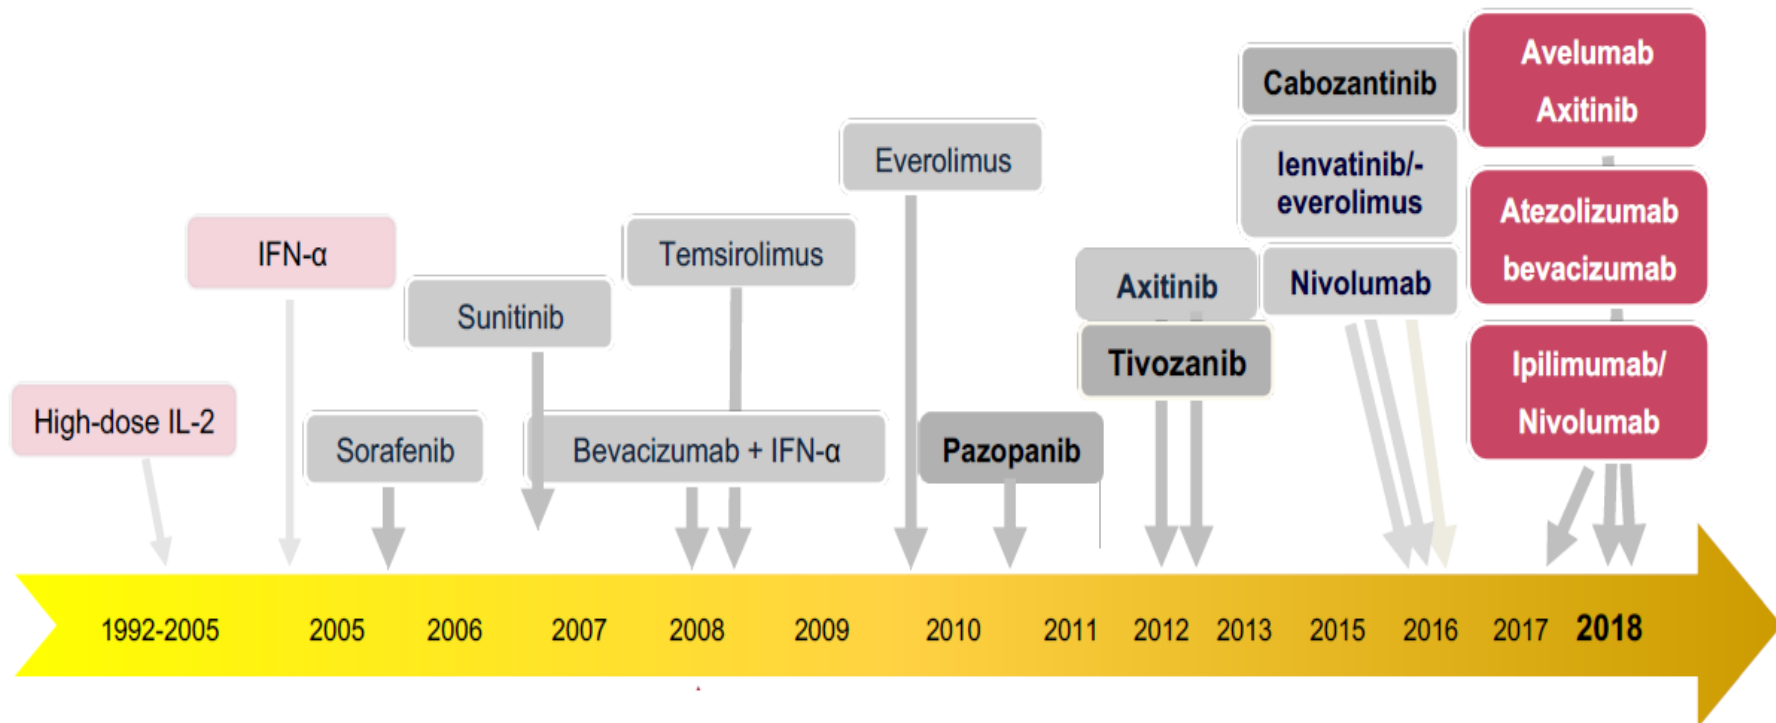

# Key Factors for Successful Therapy Management in mRCC

# ADVERSE EVENT TKI

# The Role of MET and AXL in Tumour Progression and Resistance to VEGF Receptor Inhibitors

- In RCC, MET and AXL are thought to function as escape pathways potentially contributing to resistance to more selective VEGFR-targeted therapy<sup>1</sup>

FGF, fibroblast growth factor; HIF, hypoxia-inducible factor;

# Cabozantinib Targets Multiple Distinct Pathways

- Cabozantinib is an oral small molecule inhibitor of multiple tyrosine kinase receptors, including:
  - MET
  - AXL
  - VEGFR-1, VEGFR-2, VEGFR-3
- Cabozantinib, by targeting more than just the VEGF pathway, provides a multi-targeted approach for the treatment of RCC
  - This may help to overcome resistance to VEGFR inhibition

# Cabozantinib Phase 2 Study (CABOSUN): Design

**Phase 2, randomised, multicenter, open-label study to evaluate the efficacy and safety of cabozantinib vs sunitinib in patients with previously untreated local advanced or metastatic RCC**

## Patients

- ≥18 years of age
- Locally advanced or metastatic clear-cell RCC
- Measurable disease
- Intermediate/poor risk according to the International Metastatic Renal Cell Carcinoma Database Consortium (IMDC) criteria
- No prior systemic treatment for RCC
- No active brain metastases
- ECOG PS 0–2

## Stratification factors

- IMDC risk
- Bone metastases

Cabozantinib 60 mg  
oral OD for 6 weeks

Randomisation 1:1

Sunitinib 50 mg  
oral OD for 4 weeks

## Endpoints

Primary  
▪ PFS\*

Secondary  
▪ OS  
▪ ORR  
▪ Safety

6-week cycle

Study sponsor: National Cancer Institute

OD, daily; ECOG PS, Eastern Cooperative Oncology Group performance status. \*PFS defined as time from randomisation to disease progression or death, whichever occurs first

<https://clinicaltrials.gov/ct2/show/NCT01835158>

Choueiri TK, et al. *J Clin Oncol* 2017;35:591–7 ("Errata." *J Clin Oncol*, 35(32), p. 3736)

## Phase 2 CABOSUN Study: Summary

- Cabozantinib significantly improved PFS compared with sunitinib in previously-untreated RCC patients of intermediate- and poor-risk IMDC categories:
  - 8.3 vs 5.4 months (HR = 0.56, P=0.0042) by investigator review (September 2016 cut-off)
  - 8.6 vs 5.3 months (HR = 0.48, P=0.0008) by independent review (September 2016 cut-off)
  - Benefit from cabozantinib was seen across subgroups
- Cabozantinib improved ORR over sunitinib
  - ORR: 33% vs 12% by investigator review (September 2016 cut-off)
  - ORR: 20% vs 9% by independent review (September 2016 cut-off)
- Trend towards improved OS with cabozantinib (the study was not powered to show an OS difference)
- The safety profile for cabozantinib was similar to sunitinib

# Immune Checkpoint Inhibitors: Potential as Part of a Combination Regimen

Data suggest certain combinations may overcome the limitations of monotherapy<sup>1,2</sup>

Adapted from Pardoll DM et al. *Nat Rev Cancer* 2012.<sup>1</sup>

Abbreviations, references, and footnotes are listed in the speaker notes.

# CheckMate 214: Study design

## Patients

- Treatment-naïve advanced or metastatic clear-cell RCC
- Measurable disease
- KPS  $\geq 70\%$
- Tumor tissue available for PD-L1 testing

Randomize 1:1

### Stratified by

- IMDC prognostic score (0 vs 1–2 vs 3–6)
- Region (US vs Canada/Europe vs Rest of World)

## Treatment

### Arm A

3 mg/kg nivolumab IV +  
1 mg/kg ipilimumab IV Q3W  
for four doses, then  
3 mg/kg nivolumab IV Q2W

### Arm B

50 mg sunitinib orally once  
daily for 4 weeks  
(6-week cycles)

Treatment until  
progression or  
unacceptable  
toxicity

# IMDC risk categories for RCC

| IMDC risk factors  | IMDC risk categories <sup>1</sup> | Median OS in patients treated with anti-VEGF therapy <sup>1</sup> |
|--|-----------------------------------|---|
| <ul style="list-style-type: none"><li>• KPS of 70</li><li>• &lt;1 year from diagnosis to randomization</li><li>• Hemoglobin &lt;LLN</li><li>• Corrected calcium concentration &gt;10 mg/dL</li><li>• Absolute neutrophil count &gt;ULN</li><li>• Absolute platelet count &gt;ULN</li></ul> | 0 factors = favorable             | 43 months   |
|  | 1–2 factors = intermediate        | 23 months   |
|  | 3–6 = poor                        | 8 months  |

<sup>1</sup>Heng, DYC et al. *Lancet Oncol* 2013; 14:141–48.  
<sup>2</sup>IMDC, International Metastatic RCC Database Consortium; KPS, Karnofsky performance status; LLN, lower limit of normal; ULN, upper limit of normal

# 30-Month Follow-Up of the Phase 3 CheckMate 214 Trial of First-Line Nivolumab Plus Ipilimumab or Sunitinib in Patients With Advanced Renal Cell Carcinoma

Figure 3. Any-grade treatment-related AEs occurring in >15% of patients in either arm: all treated patients

<sup>a</sup><1% reported grade 3-4 treatment-related AE; <sup>b</sup>No patients reported a grade 3-4 treatment-related AE.  
PPE, palmo-plantar erythrodysesthesia.

# Management of irAEs: general considerations

- Consistent with randomized phase 3 trials, most treatment-related AEs were of low grade and manageable with established guidelines
- Delaying the use of corticosteroids or other immunosuppressive therapy may allow the development of severe irAEs and/or life threatening complications
- irAE treatment is dependent upon severity:
  - Grade 1–2 irAEs: dose delays and observation
  - Grade 3–4 irAEs: immunosuppression with corticosteroids
- After irAE improvement, corticosteroids should be tapered over 4–6 weeks (depending on the severity of the AE)
- Good compliance with irAE management algorithms is essential

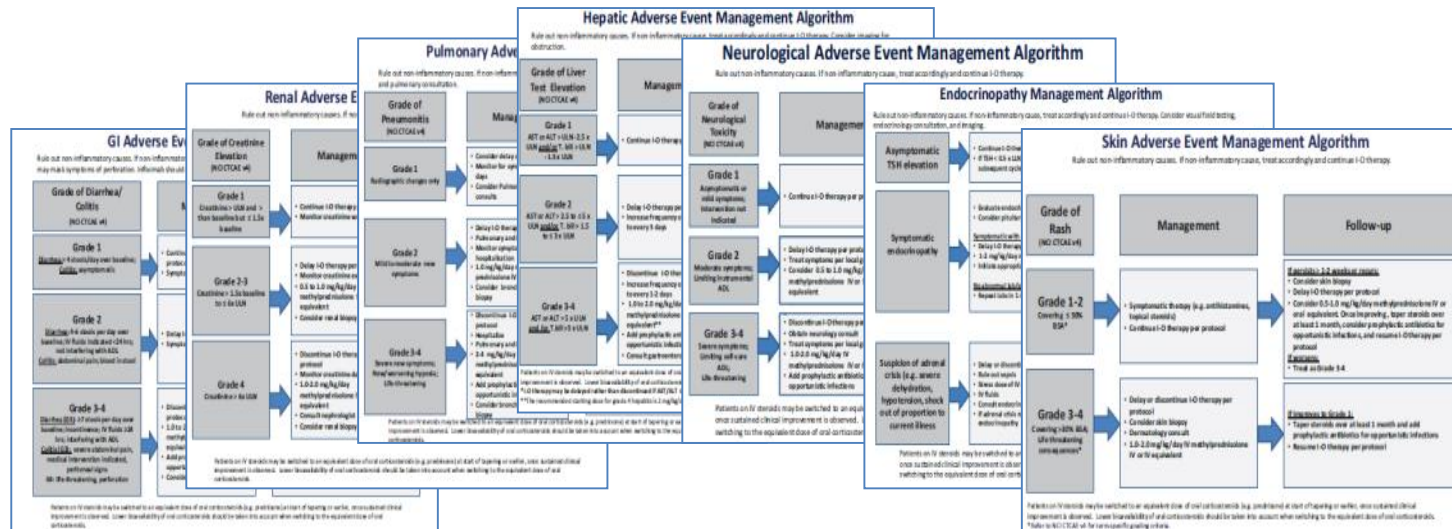

# General Rules: Management of Nivolumab-Related Select AEs

| Grade           | Management   | Continue the drug?  |
|-----------------|--|---|
| Low             | Delay the dose   | Resume Nivolumab when AEs resolve to grade $\leq 1$ or baseline |
| Moderate ~ High | Administer Corticosteroids $\pm$ Immunosuppressants (anti-TNF, mycophenolate, etc) | Discontinue Nivolumab permanently (Delay in some situations)    |

# Select Adverse Event Categories

- Potentially caused by inflammatory mechanism
  - Requiring more frequent monitoring
- Manageable with unique intervention
  - Steroid/ other immunosuppressants
  - Endocrine replacement therapy

Refer to specific algorithms in the RMP

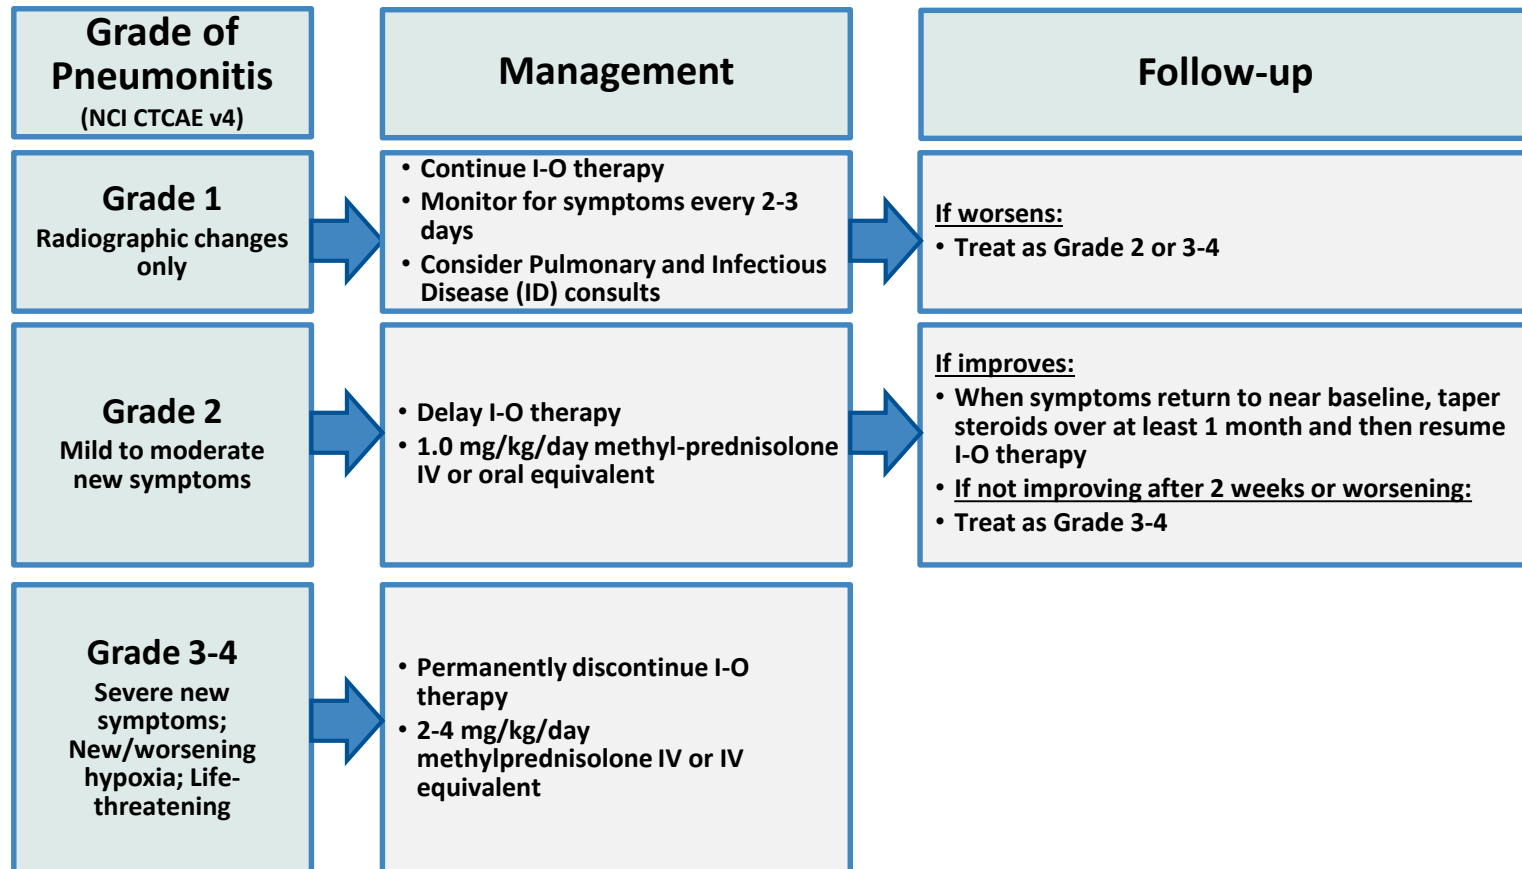

# Pneumonitis

|                    |  |
|--------------------|--|
| <b>Incidence</b>   | <ul style="list-style-type: none"> <li>Pneumonitis (including interstitial lung disease)</li> <li>All grades: 3,2%      Grades 3: 0,8%</li> <li>Grades 4: &lt;0,1%</li> <li>No grade 5 reported</li> </ul>         |

# Algorithm for Pulmonary Adverse Event

Rule out non-inflammatory causes. If non-inflammatory cause, treat accordingly and continue I-O therapy. Evaluate with imaging and pulmonary consultation.

Patients on IV steroids may be switched to an equivalent dose of oral corticosteroids (e.g. prednisone) at start of tapering or earlier, once sustained clinical improvement is observed. Lower bioavailability of oral corticosteroids should be taken into account when switching to the equivalent dose of oral corticosteroids.

Antibiotics + Antifungatives

## Phase III Assessments of VEGF + CPI Combinations in RCC

| Control   | Comparator  |
|-----------|---|
| Sunitinib | Nivolumab/Ipilimumab                                |
| Sunitinib | Bevacizumab + Atezolizumab                          |
| Sunitinib | Axitinib + Pembrolizumab                            |
| Sunitinib | Lenvatinib + Everolimus vs Lenvatinib/Pembrolizumab |
| Sunitinib | Axitinib + Avelumab                                 |
| Sunitinib | Cabozantinib/Nivolumab                              |

## Objective of combination therapy
