SCA e CCH: Come e quando?

Prof. Pilato Emanuele

Direttore UOC Cardiochirurgia
AOU Federico II - Napoli

2023 ESC Guidelines for the management of acute coronary syndromes

ACS encompasses a spectrum

Unstable angina NSTEMI STEMI

1 Think 'A.C.S.' at initial assessment

A Abnormal ECG? **C** Clinical context? **S** Stable patient?

2 Think invasive management

STEMI Very high-risk NSTEMI-ACS High-risk NSTEMI-ACS

Primary PCI OR Fibrinolysis (if timely primary PCI not feasible) Immediate angiography ± PCI Early (<24 h) angiography should be considered

3 Think antithrombotic therapy

Antiplatelet therapy AND Anticoagulant therapy

Aspirin + P2Y₁₂ inhibitor UFH OR LMWH OR Bivalirudin OR Fondaparinux

4 Think revascularization

Based on clinical status, co-morbidities, and disease complexity Aim for complete revascularization Consider adjunctive tests to guide revascularization

PCI OR CABG Intravascular imaging Intravascular physiology

5 Think secondary prevention

Antithrombotic therapy Lipid lowering therapy Smoking cessation Cardiac rehabilitation Risk factor management Psychosocial considerations

4 Think revascularization

Based on clinical status, co-morbidities, and disease complexity Aim for complete revascularization Consider adjunctive tests to guide revascularization

PCI OR CABG Intravascular imaging Intravascular physiology

5 Think secondary prevention

Antithrombotic therapy Lipid lowering therapy Smoking cessation Cardiac rehabilitation Risk factor management Psychosocial considerations

Recommendation Table 12 — Recommendations for management of patients with multivessel disease

Recommendations	Class ^a	Level ^b
It is recommended to base the revascularization strategy (IRA PCI, multivessel PCI/CABG) on the patient's clinical status and comorbidities, as well as their disease complexity, according to the principles of management of myocardial revascularization. ^{480,481}	I	B
Multivessel disease in ACS patients presenting in cardiogenic shock		
IRA-only PCI during the index procedure is recommended. ^{404,505}	I	B
Staged PCI of non-IRA should be considered. ^c	IIa	C

PCI

CABG

FAVOURS PCI

Clinical characteristics

Presence of severe co-morbidity (not adequately reflected by scores)

Advanced age/frailty/reduced life expectancy

Restricted mobility and conditions that affect the rehabilitation process

Anatomical and technical aspects

MVD with SYNTAX score 0-22

Anatomy likely resulting in incomplete revascularization with CABG due to poor quality or missing conduits

Severe chest deformation or scoliosis

Sequelae of chest radiation

Porcelain aorta*

FAVOURS CABG

Clinical characteristics

Diabetes

Reduced LV function (EF \leq 35%)

Contraindication to DAPT

Recurrent diffuse in-stent restenosis

Anatomical and technical aspects

MVD with SYNTAX score \geq 23

Anatomy likely resulting in incomplete revascularization with PCI

Severely calcified coronary artery lesions limiting lesion expansion

Need for concomitant interventions

Ascending aortic pathology with indication for surgery

Concomitant cardiac surgery

Recommendation Table 9 — Recommendations for cardiogenic shock

Recommendations	Class ^a	Level ^b
Immediate coronary angiography and PCI of the IRA (if indicated) is recommended in patients with CS complicating ACS. ^{394,396,404}	I	B
Emergency CABG is recommended for ACS-related CS if PCI of the IRA is not feasible/unsuccessful. ^{394,395}	I	B
In cases of haemodynamic instability, emergency surgical/catheter-based repair of mechanical complications of ACS is recommended, based on Heart Team discussion.	I	C
Fibrinolysis should be considered in STEMI patients presenting with CS if a PPCI strategy is not available within 120 min from the time of STEMI diagnosis and mechanical complications have been ruled out. ^{184,354}	IIa	C

Continued

- Papillary muscles ruptures
- Free wall rupture
- Post-AMI Ventricular septal defect
- Very low LVEF

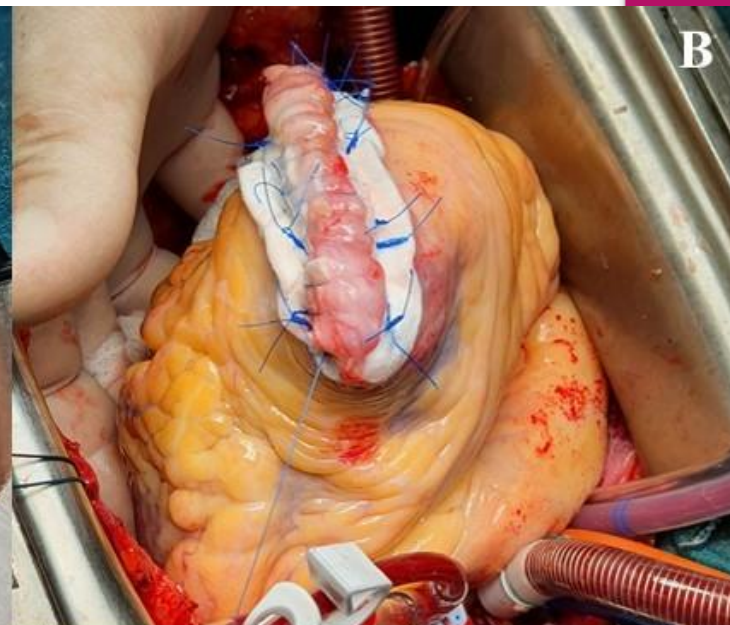

Peri-procedural
carefull optimization

- IABP, pVAD
- Inotropic support
- Fluid Balance
- Myocardial Protection

Free Wall Rupture

Papillary muscles rupture

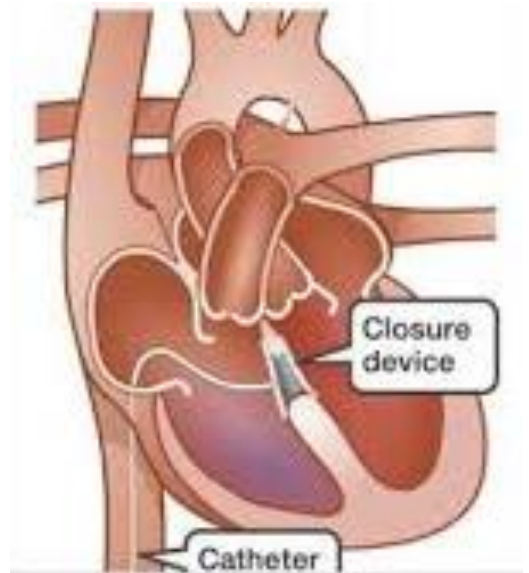

Ventricular septal defect

Ventricular septal defect

Ventricular septal defect

Very Low Ejection Fraction

Long-term Outcomes in Patients With Severely Reduced Left Ventricular Ejection Fraction Undergoing Percutaneous Coronary Intervention vs Coronary Artery Bypass Grafting

Louise Y. Sun, MD, SM^{1,2,3}; Mario Gaudino, MD⁴; Robert J. Chen, MD¹; et al

Results A total of 12113 patients (mean [SD] age, 64.8 (11.0) years for the PCI group and 65.6 [9.7] years for the CABG group; 5084 (72.5%) male for the PCI group and 4229 (82.9%) male for the CABG group) were propensity score matched on 30 baseline characteristics: 2397 patients undergoing PCI and 2397 patients undergoing CABG. The median follow-up was 5.2 years (interquartile range, 5.0-5.3). Patients who received PCI had significantly higher rates of mortality (hazard ratio [HR], 1.6; 95% CI, 1.3-1.7), death from cardiovascular disease (HR 1.4, 95% CI, 1.1-1.6), MACE (HR, 2.0; 95% CI, 1.9-2.2), subsequent revascularization (HR, 3.7; 95% CI, 3.2-4.3), and hospitalization for MI (HR, 3.2; 95% CI, 2.6-3.8) and heart failure (HR, 1.5; 95% CI, 1.3-1.6) compared with matched patients who underwent CABG.

Sun LY, et al. *JAMA Cardiol*. Published online April 08, 2020

Figure 1. Estimated Long-term Survival After Percutaneous Coronary Intervention (PCI) vs Coronary Artery Bypass Grafting (CABG)

Conclusions and Relevance In this study, higher rates of mortality and MACE were seen in patients who received PCI compared with those who underwent CABG. The findings may provide insight to physicians who are involved in decision-making for these patients.

The role of Del Nido Cardioplegia in reducing postoperative atrial fibrillation after cardiac surgery in patients with impaired cardiac function

Giuseppe Comentale, MD^{a,*}, Valentina Parisi, MD^b, Vittoria Fontana, MD^a, Rachele Manzo, MD^a, Maddalena Conte, MD^b, Anna Nunziata, MD^a, Giovanna Bevilacqua, MSc^a, Mariarita Buono, MSc^a, Shadi Hamameh, MD^a, Emanuele Pilato, MD^a

Single-Center Retrospective analysis

4 years data: - Cardiac Surgery Unit, AOU Federico II

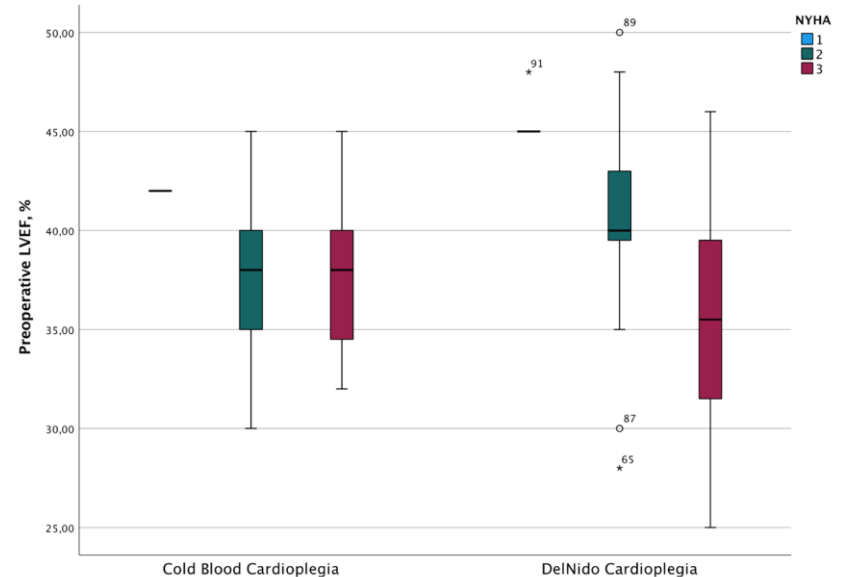

Study Population: 93 CABG patients with LVEF \leq 50%

- 49 pts - Cold Blood Cardioplegia (Group 1)
- 44 pts - Del Nido Cardioplegia (Group 2)

Primary outcomes:

- Ventricular Fibrillation rate at Xclamp removal
- Perioperative Inotropic need
- Postoperative iTroponine release

to evaluate the role of Del Nido Cardioplegia on myocardial protection and perioperative outcomes of patients with reduced left ventricle ejection fraction undergoing CABG surgery

Variables	Overall (n=93)	Cold Blood Cardioplegia (n= 49, 52.7%)	Del Nido Cardioplegia (n= 44, 47.3%)	P-value
pp3SAIb, g/dL	3.1 [2.9; 3.3] (2 to 3.7)	3.06 [2.85; 3.2] (2 to 3.63)	3.2 [2.9; 3.4] (2.2 to 3.7)	0.01
